- Refer a friend
- Learn about our staff and services
- Access a wealth of dental health information
- Read our previous newsletters
- Provide valuable feedback and contact us

As always, our office has been busy attending continuing education courses. Dr. Bill and our hygienists, Linda and Stacie, recently attended a course on local anesthesia at the University of Pittsburgh School of Dental Medicine. They also were re-trained under the new guidelines for Basic Life Support and CPR. Dr. Bill additionally participated in an intensive hands-on workshop on nitrous oxide sedation techniques at The University of Pennsylvania School of Dental Medicine in Philadelphia. We are proud to announce that Stacie received her Public Health Dental Hygiene Practitioner license. This allows her to work independently providing oral care services

in a public health setting. Our office is proud of the fact that our two hygienists, Linda and Stacie, are among the handful of hygienists in the state that have this license.

We had the great pleasure of visiting St. George's Kindergarten and Pre-School classes with our very own Toothfairy for dental health presentations. The kids were attentive and greatly enjoyed our visit. They were happy to meet the Toothfairy in person!

Our office is pleased to provide WiFi service to our patients while they are in our office. Feel free to bring your smart phone, laptop, iPads or any other device and en-

joy the internet. Sorry, we do not have in-office Starbucks yet ... but we're working on it!

We hope that you have enjoyed the wonderful winter here in northwestern Pennsylvania.

And the winner is ...

... Linda, our hygienist! We are proud to announce that Linda was the recipient of the national Trident Xtra Care Award. Linda received this award in recognition of her outstanding community service while using Trident to help improve the oral health of mem-

bers in her community. Trident was impressed with her coordination with the Erie Zoo for the Zoo Boo events, volunteering for school dental health presentations, and patient education efforts including this quarterly newsletter series. Linda received a one-year

supply of Trident gum, a \$500.00 gift card and was featured in her industry publication, RDH Magazine, and several websites. She was also featured in the Erie Times News on February 27th as the "Mover of the Week". Congratulations Linda!

Fluoride is a mineral that has the ability to strengthen tooth enamel

Service Spotlight: Topical Fluoride Treatment

Fluoride is a mineral that occurs naturally in many foods and water, and has the unique ability to strengthen tooth enamel.

Enamel, the hardest substance in nature, is made up of a crystalline substance called calcium hydroxyapatite. When fluoride is incorporated to the enamel it becomes calcium fluorapatite, which is much more resistant to the acid attacks that cause decay.

Fluoride ions can become incor-

porated into the tooth surface quite readily by topical application. A dentist or dental hygienist can apply fluoride to the teeth as a gel, foam, or varnish. These treatments contain a much higher level of fluoride than the amount found in toothpastes and mouth rinses. Varnishes are painted on the teeth; foams are put into a mouth guard, which is applied to the teeth for 1 to 4 minutes; gels can be painted on or applied via a mouth guard.

Although it is recommended that children to receive this treatment, many adults can also benefit from it. Topical fluoride treatments are beneficial for those with dry mouth conditions, exposed root surfaces, a history of frequent cavities, current orthodontic treatment, poor oral hygiene, developmental or enamel defects, eating disorders, and those with an acidic oral environment due to diet or gastrointestinal issues.

HHS is expecting to publish final guidance for community water fluoridation by spring 2011.

Children's Dental Health: Water Fluoridation

The U.S. Department of Health and Human Services (HHS) and the U.S. Environmental Protection Agency (EPA) are announcing important steps to ensure that standards and guidelines on fluoride in drinking water continue to provide the maximum protection to the American people to support good dental health, especially in children. HHS is proposing that the recommended

level of fluoride in drinking water can be set at the lowest end of the current optimal range to prevent tooth decay, and EPA is initiating review of the maximum amount of fluoride allowed in drinking water. HHS' proposed recommendation of 0.7 milligrams of fluoride per liter of water replaces the current recommended range of 0.7 to 1.2 milligrams. This updated recommendation is based on recent EPA

and HHS scientific assessments to balance the benefits of preventing tooth decay while limiting any unwanted health effects. These scientific assessments will also guide EPA in making a determination of whether to lower the maximum amount of fluoride allowed in drinking water, which is set to prevent adverse health effects.

Christine Hubbard

Feature Patient: Christine Hubbard

We love showcasing our patients and this issue's Feature Patient is Christine Hubbard. Christine traveled extensively with her family, known as the "Lawrence Family", a singing family who had a weekly television and radio program. She also plays the piano and guitar and sings. Chris-

tine ran for Mrs. Pennsylvania in 2002 and won the prestigious title of "Mrs. Congeniality". She was a 2010 Roar on the Shore contest and raised over \$1,500.00 for the affiliated "Big Back Yard Project" for SafeNet. She is a graduate of Edinboro University with a B.S.W., and is currently in gradu-

ate school to obtain her Master's degree in Social Work. She is also an intern at the Mercy Center for Women and aspires to be a Licensed Clinical Therapist with her own practice. Christine has two children, which she considers to be her greatest accomplishment. She loves being a Mom!

Did You Know ...

... that Dr. Bill and Stacie ride motorcycles? Dr. Bill has a Kawasaki Vulcan Nomad and Stacie has a Yamaha V-Star.

They are anxiously awaiting spring to get here, and a heavy rain to clean off of the roads to be able to get back out on their bikes. The six month motorcycle hibernation in Erie is very difficult for them!

Dr. Bill rode in the Roar on the Shore last summer. He is proud

to be a corporate sponsor for this event, and a member of the Manufacturer's Association. His favorite trip, however, is a leisurely ride to Lexington, Kentucky to visit his three daughters, son-in-law and grandson, James.

Stacie enjoys sunset rides around Presque Isle and often rides along side her parents on their Honda Goldwing.

In the summertime, both Dr. Bill and Stacie can often be found

eating a "Large Marge" or a "Big Ed" while drinking gigantic rootbeer floats at the White Turkey in Conneaut, Ohio. If they're not there, you may find them at Eddie's in Geneva-On-The-Lake, Ohio indulging in their famous fried hot dogs and cruising the strip.

They both hope someday to ride their bikes around Lake Erie.

This may be their summer!

Prevention is the Key: Omega-3 & Inflammation

You probably know omega-3 fatty acids best for their role in preventing heart disease, but did you know they prevent gum disease too? Periodontitis, a type of gum disease that causes tooth loss, may be tamed by taking omega-3 fatty acid supplements – or by adding more foods rich in omega-3 fatty acids to your diet. And that's a good thing if you want to keep your smile.

In a study published in the Journal of the American Dietetic Association, researchers confirmed the tooth-conserving power of omega-3 fatty acids. When they looked at data on over 9,000 adults, they found those who had the most DHA (a type of omega-3) in their diet reduced their risk of periodontitis by 20%. Even modest amounts of dietary omega-3 fatty acids offered protection against this common form of inflammatory gum disease.

Periodontitis is one of the most

frequent causes of tooth loss. It usually comes from poor oral hygiene that allows plaque to build up along the gum line and at the base of the teeth. When this happens, bad bacteria move in, and the body launches an all-out immune response to ward off the bacterial invaders. It's the aggressive nature of the immune response that causes many of the changes seen with periodontitis – changes that can eventually lead to destruction of the bone around the teeth and tooth loss.

How do omega-3 fatty acids help to prevent gum disease and periodontitis? Research shows that omega-3 fatty acids have anti-inflammatory properties, which helps to ease the inflammation people with periodontitis have. Researchers from the University of Kentucky also found that omega-3 fatty acids slow down and even stop the growth of bacteria that cause gum disease and periodontitis. Taking omega-3

fatty acids packs a double wallop against the destructive bacteria that hid out inside your mouth.

Taking omega-3 fatty acid supplements (2 grams per day) could be just what the dentist ordered for preventing gum disease. Omega-3 fatty acids are safe for most people with the exception of people who have bleeding disorders or people on blood thinners. The other option is to add more foods rich in omega-3s to your diet such as salmon, mackerel, sardines, and anchovies.

Don't forget to brush and floss twice daily and get a professional cleaning every six months – to remove tartar and plaque that can lead to gum disease. Keep your beautiful smile with good oral hygiene – and a diet rich in omega-3 fatty acids.

Dr. William Hammerlee has been a dentist in Erie, Pennsylvania since 1984. Raised in Corry, Pennsylvania he is a graduate of Asbury College in Wilmore, Kentucky and The University of Pittsburgh School of Dental Medicine in Pittsburgh, PA. Dr. Hammerlee is a member of the American Dental Association, the Pennsylvania Dental Association and the Erie County Dental Association, as well as the Academy of General Dentistry.

excellence in a comfortable setting

Q & A: Should I use a soft, medium or hard toothbrush?

The answer is definitely soft. The American Dental Association (ADA) recommends using soft bristles because they are much gentler on the gums and less abrasive on the enamel of your teeth. However, Clifford Wahl, director of the ADA's seal of approval program, states, "One manufacturer's soft could be another's medium." Because of this, the ADA puts its seal on a variety of firm, medium and soft toothbrushes, which involves a bit of trial and error on behalf of the user.

No one should be using a medium or hard toothbrush, and people with sensitive teeth,

gum recession or exposed root surfaces of the teeth should be using an extra soft toothbrush.

The best toothbrush to use fits comfortably in your mouth and is not abrasive to your teeth or gums. Try to select a toothbrush with soft, straight bristles and a head that will reach all your teeth when you brush. Having a toothbrush that feels comfortable when you use it will encourage you to brush your teeth at least twice a day. Proper brushing is also important. Don't be heavy-handed, saw back and forth or spend over two minutes brushing. Correct brushing technique is of the utmost

importance. We give our patients soft or extra soft toothbrushes and the Oral B Professional Series power toothbrushes available through our office come with soft bristle heads. Feel free to ask us here at the office for toothbrush recommendations that are appropriate for you and your particular circumstances.

Always use a soft toothbrush to prevent damage to your tooth structure or gums
